Applications of Propositional Logic Section 1.2

Applications of Propositional Logic: Summary

- Translating English to Propositional Logic
- System Specifications
- Boolean Search
- Logic Puzzles
- Logic Circuits

Translating English Sentences

- Steps to convert an English sentence to a statement in propositional logic
 - Identify atomic propositions and represent using propositional variables.
 - Determine appropriate logical connectives
- "If I go to Harry's or to the country, I will not go shopping."
 - p: I go to Harry's
 - q: I go to the country.
 - *r*: I will go shopping.

If *p* or *q* then not *r*.

 $(p \lor q) \to \neg r$

Example: Translate into propositional logic

"You can access the Internet from campus only if you are a computer science major or you are not a freshman."

One Solution:

a: "You can access the internet from campus" *c*: "You are a computer science major" *f*: "You are a freshman."

$$a \rightarrow (c \lor \neg f)$$

System Specifications

- System and Software engineers take requirements in English and express them in a precise specification language based on logic.
 - **Example**: Express in propositional logic:
 - "The automated reply cannot be sent when the file system is full"
 - **One solution**: Let *p* denote "The automated reply can be sent" and *q* denote "The file system is full."

 $q \rightarrow \neg p$

Consistent System Specifications

Definition: A list of propositions is *consistent* if it is possible to assign truth values (T/F) to the proposition variables so that each compound proposition in the list is true.

Exercise: Are these specifications consistent?

- "The diagnostic message is stored in the buffer or it is retransmitted."
- "The diagnostic message is not stored in the buffer."
- "If the diagnostic message is stored in the buffer, then it is retransmitted."

Solution: *p*: "The diagnostic message is stored in the buffer."

q: "The diagnostic message is retransmitted."

When *p* is false and *q* is true all three statements are true. So the specification is consistent.

p V q $\neg p$ $p \rightarrow q$

Consistent System Specifications

Exercise: What if the specification "The diagnostic message is not retransmitted" is added? Is it still consistent?

- "The diagnostic message is stored in the buffer or it is retransmitted." $P \lor q$
- "The diagnostic message is not stored in the buffer." ¬p
- "If the diagnostic message is stored in the buffer, then it is $P \rightarrow q$ retransmitted."
- "The diagnostic message is not retransmitted." $\neg q$

Solution: There is no satisfying assignment. The specification is **not consistent**.

Consistent System Specifications

- "The diagnostic message is stored in the buffer or it is retransmitted."
- "The diagnostic message is not stored in the buffer."
- "If the diagnostic message is stored in the buffer, then it is retransmitted."
- What if "The diagnostic message is not retransmitted" is added.

р	q	p V q	¬p	$p \rightarrow q$	¬q
F	F	F	Т	Т	Т
F	Т	Т	Т	Т	F
Т	F	Т	F	F	Т
Т	Т	Т	F	Т	F

Boolean Search

- Logical connectives are used extensively in searches of large collections of information.
- Boolean search is a type of search allowing users to combine keywords with Logical connectives to further produce more relevant results.
- In Boolean searches,
 - *AND* is used to match records that contain both of two search terms.
 - *OR* is used to match one or both of two search terms.
 - *NOT* (sometimes written as *AND NOT*) is used to exclude a particular search term.
- Example (Web Page Searching):
 - Most Web search engines support Boolean searching techniques.
 - For instance, using Boolean searching to find Web pages about universities in New Mexico.
 - Search "NEW AND MEXICO AND UNIVERSITIES".
 - The results of this search will include those pages that contain the three words NEW, MEXICO, and UNIVERSITIES.

Logic Puzzles

Raymond Smullyan (Born 1919)

- An island has two kinds of inhabitants, *knights*, who always tell the truth, and *knaves*, who always lie.
- You go to the island and meet A and B.
 - A says "B is a knight."
 - B says "The two of us are of opposite types."
 - **Example**: What are the types of A and B?

Solution: Let *p: "A is a knight"* and *q: "B is a knight*.

So, then $\neg p$: "*A* is a knave" and $\neg q$: "*B* is a knave."

- If A is a knight, then p is true. Since knights tell the truth, q must also be true. Then (p ∧ ¬q)∨ (¬p ∧ q) would have to be true, but it is not. So, A is not a knight and therefore ¬p must be true.
- If A is a knave, then B must not be a knight since knaves always lie. So, then both ¬p and ¬q hold since both are knaves.

Logic Circuits

(Studied in depth in Chapter 12)

- Electronic circuits; each input/output signal can be viewed as a o or 1.
 - o represents False/Off
 - 1 represents True/On

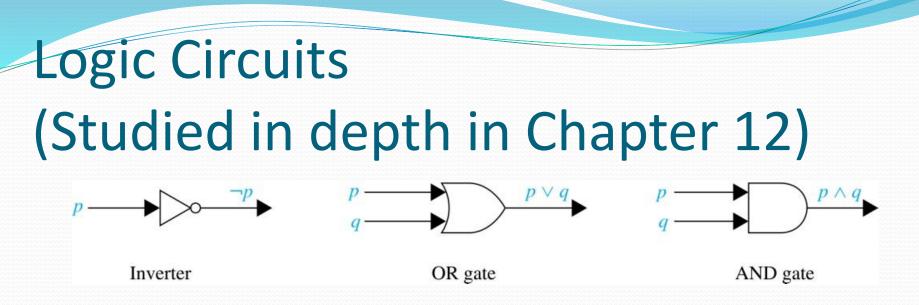

Inverter

- Complicated circuits are constructed from three basic circuits called gates.
 p p q
 p p q
 p p q
 p p q
 - The inverter (**NOT gate**)takes an input bit and produces the negation of that bit.

OR gate

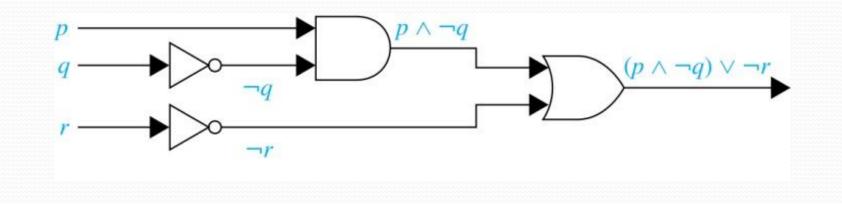

AND gate

- The **OR gate** takes two input bits and produces the value equivalent to the disjunction of the two bits.
- The **AND gate** takes two input bits and produces the value equivalent to the conjunction of the two bits.

• More complicated digital circuits can be constructed by combining these basic circuits to produce the desired output given the input signals by building a circuit for each piece of the output expression and then combining them.

• For example, this circuit results in $(p \land \neg q) \lor \neg r$

Example

Build a digital circuit that produces the output:

•
$$(p \lor \neg r) \land (\neg p \lor (q \lor \neg r))$$

• when given input bits *p*, *q*, and *r*.
